

RPIC Community App

A digital platform for member welfare, financial transparency, and efficient service delivery

Proposal in brief: The Research Planning and Innovation Center (RPIC) Community App will centralize member records, contributions, withdrawals, emergency requests, and protected documents in one secure system. The platform is designed to improve transparency, reduce delays, strengthen accountability, and make it easier for members and leaders to access the information and services they need.

1. Background and Rationale

The Research Planning and Innovation Center Community manages important welfare and financial support processes for its members. These include member contributions, withdrawals, emergency support requests, and access to official financial and governing documents. When these processes are handled manually or across fragmented tools, service delivery becomes slower, records become harder to verify, and leadership has limited visibility into fund activity and member status.

The RPIC Community App is proposed as a practical digital solution that preserves the community's existing workflows while making them more transparent, secure, and efficient.

2. Problem Statement

Current administrative processes can create avoidable delays, inconsistent records, and limited traceability. Members may not easily track their requests or contribution history, while administrators and treasurers can struggle to maintain a complete and auditable financial picture.

3. Goal and Objectives

Goal: To establish a secure and user-friendly platform for community welfare, financial administration, and member services.

- Centralize member, contribution, withdrawal, emergency request, and document workflows in one system.
- Improve transparency and accountability through structured records and approval tracking.
- Give members easier access to their account information and service requests.
- Provide leadership with dashboards and summaries for faster oversight and decision-making.
- Protect sensitive financial and governance documents through role-based access.

4. Proposed Solution

The RPIC Community App will provide role-based access for administrators, treasurers, and members. Members will be able to review their own records, submit emergency requests, and access protected documents where authorized. Administrators and treasurers will be able to manage approvals, financial entries, member status, and official records through a centralized dashboard.

5. Expected Benefits to End Users

User group	Key needs today	Benefit from the app
Members	Need visibility into their own balances, contributions, requests, and official documents.	Faster service, self-service access, and clearer follow-up on emergency support and transactions.
Administrators	Need a reliable way to manage records, member status, and service workflows.	Centralized administration, better record quality, and easier tracking of actions and responsibilities.
Treasurers	Need strong oversight of financial activity and approval workflows.	Clearer audit trail, better monitoring of fund activity, and improved confidence in decisions.

6. Why Adoption Matters

The proposed platform is not just a technology upgrade; it is an operational improvement. It will reduce dependence on fragmented records, shorten turnaround time for member services, strengthen trust through transparent workflows, and create continuity even when office bearers change.

7. Implementation Approach

- Validate end-user expectations and confirm approval responsibilities.
- Demonstrate the platform to leadership and operational users.
- Onboard initial member records and protected documents.
- Train members, administrators, and treasurers on the relevant functions.
- Roll out the platform in phases and refine it through feedback.

8. Conclusion

The RPIC Community App offers a strong foundation for modern, transparent, and efficient community administration. It is recommended for adoption as the official digital platform for welfare, financial records, emergency support processing, and protected document access.
